

Npm Install

- The packages used in the code. (That we are working with)

npm install <package name> --save
or
npm install <package name>

- The packages that used only in development.

npm install <package name> --save-dev

Ex : nodemon → When saving the project it will automatically restart the server.

- Install packages globally. (Not only for current project)

npm install <package name> -g

In the *package.json* file all the installed packages can be seen.
